Ambient Air Quality	

PREFACE

M/S Hindalco Industries Limited entrusted environmental quality monitoring at **Durgmanwadi Bauxite Mine** situated Radhanagari Taluka, Kolhapur district, Maharashtra to **Bhagavathi Ana Labs Pvt. Limited**, during winter season of the year 2017-18.

The environmental monitoring was carried out in core zone and buffer zone during the months of December, January & February 2017-18 for the following environmental parameters.

- Micro-meteorology
- Ambient air quality
- Ambient noise level quality
- Water quality

The data obtained was compiled to assess the current environmental status of the mining as well as the surrounding villages in the study area.

Bhagavathi Ana Labs Pvt. Limited, gratefully acknowledges the cooperation extended by management and staff of M/S Hindalco Industries Limited and the village people to the field staff.

EXECUTIVE SUMMARY

Durgamanwadi Bauxite Mine environmental quality monitoring includes the monitoring of ambient air quality, noise level quality, water quality, & micro-meteorology in core zone and buffer zone around the mine lease area.

AMBIENT AIR QUALITY

The scenario of the existing ambient air quality in the study region has been assessed through a network of selected ambient air quality locations. Pre-calibrated respirable dust sampler has been used for monitoring the existing AAQ status. Maximum, minimum, average and percentile values have been computed from the data collected at all individual sampling stations to represent the ambient air quality status.

AMBIENT NOISE LEVEL MONITORING

Mining and allied activities usually cause noise pollution. Excessive noise levels will cause adverse effects on human beings and associated environment including domestic animals, wild life, natural ecosystem and structures. To know the ambient noise levels in the study area, noise levels were recorded at mining area and nearby villages using noise level recorder.

WATER QUALITY MONITORING

Water quality monitoring consists of the study of surface and ground water sources and its quality in the core and buffer zone of the lease area. Assessment of water quality in the study area and in the mine area includes the quality assessment of parameters as per the Indian Standard IS 10500 (Drinking water standard). Water samples were collected from selected locations during study period and analyzed in the laboratory as per the standard IS&APHA procedures.

MICROMETEOROLOGY

Meteorological scenario helps to understand the trends of the climatic factors. It also helps in the identification of sampling stations in the study area. Meteorological scenario exerts a critical influence on air quality as the pollution arises from the interaction of atmospheric contaminants with adverse meteorological conditions

MICRO-METEOROLOGY

Meteorological data within the project area during the air quality survey period was assessed

PRIMARY / BASIC METEOROLOGICAL PARAMETERS

- Wind Velocity
- Wind Direction

Since the dispersion and diffusion of pollutants mainly depend on the above factors these factors are considered as primary meteorological parameters.

SECONDARY METEOROLOGICAL PARAMETERS

- Ambient Temperature

ENVIRONMENTAL QUALITY

Environmental monitoring includes air, noise, water quality status within core zone and buffer zone around the Durgmanwadi Bauxite Mines Lease area at Radhanagari Taluka, Kolhapur district, Maharashtra.

AMBIENT AIR QUALITY

The ambient air quality monitoring was to assess the existing levels of the air pollution as well as the regional background concentration in the project area. Air pollution forms an important and critical factor to study the environmental issues in the mining areas. Thus, air quality has to be frequently monitored to know the extent of pollution due to mining and allied activities.

Ambient air quality monitoring stations were set up at eight selected locations, 3 in core zone and 5 in buffer zone.

METHOD OF SAMPLING

Ambient air quality monitoring has been carried out using APM-460BL instruments placed at a height of 3mts from the ground level with a frequency of two days per week at eight locations for one season (i.e. 24 times at each location in a season). The baseline data for air environment is generated for the parameters like suspended particulate matter (SPM), Particulate matter (PM10), Sulphur Dioxide (SO₂) and Oxides of Nitrogen (NO₂):

AMBIENT NOISE LEVEL QUALITY

Noise is nothing but unwanted sound produced due to various activities. As a part of occupational health and safety measures, certain safeguards have been incorporated to mitigate noise pollution in working environment. So noise level surveys were carried out at 8 selected locations in and around the mine lease area. Noise survey has been conducted in the study area for the period of 24 hr at each location. The noise level results are given below.

AMBIENT NOISE LEVEL MONITORING STATIONS

SL. NO	CODE	NAME OF SAMPLING LOCATION	DIRECTION w.r.t. MINES
1	N - 1	Core zone	--
2	N - 2	Near Mines Office	--
3	N - 3	Mines Haulage Road	--
4	N - 4	Padsali village	N
5	N - 5	Durgmanwad village	E

NOISE AMBIENT STANDARDS

AREA CODE	CATEGORY OF AREA	LIMIT IN dB (A) Leq	
		DAY TIME	NIGHT TIME
A	Industrial Area	75	70
B	Commercial Area	65	55
C	Residential Area	55	45
D	Silence Area	50	40

Note:

1. Day time is reckoned in between 6 am and 9 pm.
2. Night time is reckoned in between 9 pm and 6 am.
3. Silence zone is defined as area upto 100 meters around such premises as hospitals, educational institutions and courts. The silence zones are to be declared by the Competent Authority.
4. Mixed categories of areas should be declared as "one of the four above mentioned categories by the Competent Authority and the corresponding standards shall apply.

Maximum Value: - (L_{Max})	71.5	72.9	75.0	74.5	67.4

RESULT & DISCUSSION

The obtained L_d, L_n noise levels are compared with the ambient noise level standards and are found to be within the limit.

WATER QUALITY

Water quality monitoring consists of the study of water sources and its quality in the core and buffer zone of the lease area. Its study consists of following two important systems of water bodies:

- Surface water quality.
- Ground water quality.

The buffer zone is good in ground and surface water source. The rainwater regularly recharges this ground water during rainy season. There are two streams flowing in the study area, which are considered to be good source of water.

Assessment of water quality in the study area and in the mine area includes the quality assessment of parameters as per the IS 10500 (Drinking Water Standard). A total of 6 quality monitoring stations selected for sample collection in the study area. Location of water quality monitoring stations is given in Table.

WATER QUALITY MONITORING LOCATIONS

Sl. No	Name of Sampling Station	Source of Water
1	W1 Talgaon village	Ground water
2	W2 Durgamanwadi village	Ground water
3	W3 Chavanwadi village	Ground water
4	W4 Padsali village	Surface water
5	W5 Tulsi stream	Surface water
6	W6 Mine Accumulated water	Surface water

SAMPLING DETAILS

The water samples were collected from selected sampling locations, which are coming under core zone and buffer zone around the mine lease area. Samples were collected in the winter season as per the prescribed sample collecting methods and analyzed as per the IS & APHA standard procedures. analysis report of water samples are given below.

4	BOD for 3 days at 27°C, mg/l	4
5	Total Solids	79
6	Oil and Grease, mg/l	5

RESULTS & DISCUSSION

- The pH of the study area varies from 6.54 to 6.74 in the study area. The permissible range of pH is 6.5 to 8.5.
- Dissolved Oxygen content of the study area has been found to be in the range of 4.10 to 7.20.
- Total Dissolved Solids found to be in the range of 20 to 132 mg/l in the water sample collected in study area. As per IS 10500 standard for drinking water, the desirable limit is 500 mg/l and maximum permissible limit is 2000 mg/l.
- Alkalinity as CaCO_3 is found to be in the range of 16 to 62 in the water sample collected in study area. As per IS 10500 standard for drinking water, the desirable limit is 200 mg/l and maximum permissible limit is 600 mg/l.
- Total hardness as CaCO_3 of the water sample collected in the study area is found to be in the range of 20 to 104 mg/l. As per IS 10500 standard for drinking water, the desirable limit is 300 mg/l and maximum permissible limit is 600 mg/l.
- Chloride content of the water in the study area found to be in the range of 7.73 to 15.47 mg/l. As per IS 10500 standard for drinking water, the desirable limit 250 mg/l and maximum permissible limit is 1000 mg/l.
- Calcium content of the water in the study area found to be in the range of 5.60 to 25 mg/l. As per IS 10500 standard for drinking water, the desirable limit 75 mg/l and maximum permissible limit is 200 mg/l.
- Magnesium content of the water in the study area found to be in the range of 1.44 to 12 mg/l.
- Iron content of the water in the study area found to be in the range of 0.14 to 0.89 mg/l. As per IS 10500 standard for drinking water, the desirable limit 0.3 mg/l and maximum permissible limit is 1.0 mg/l.

**DRINKING WATER STANDARDS

Ambient Air Quality	

PREFACE

M/S Hindalco Industries Limited entrusted environmental quality monitoring at **Durgmanwadi Bauxite Mine** situated Radhanagari Taluka, Kolhapur district, Maharashtra to **Bhagavathi Ana Labs Pvt. Limited, Hyderabad** during Post Monsoon season of the year 2017.

The environmental monitoring was carried out in core zone and buffer zone during the months of September, October & November 2017 for the following environmental parameters.

- Micro-meteorology
- Ambient air quality
- Ambient noise level quality
- Water quality

The data obtained was compiled to assess the current environmental status of the mining as well as the surrounding villages in the study area.

Bhagavathi Ana Labs Pvt. Limited, Hyderabad gratefully acknowledges the cooperation extended by management and staff of M/S Hindalco Industries Limited and the village people to the field staff.

EXECUTIVE SUMMARY

Durgamanwadi Bauxite Mine environmental quality monitoring includes the monitoring of ambient air quality, noise level quality, water quality, & micro-meteorology in core zone and buffer zone around the mine lease area.

AMBIENT AIR QUALITY

The scenario of the existing ambient air quality in the study region has been assessed through a network of selected ambient air quality locations. Pre-calibrated respirable dust sampler has been used for monitoring the existing AAQ status. Maximum, minimum, average and percentile values have been computed from the raw data collected at all individual sampling stations to represent the ambient air quality status.

AMBIENT NOISE LEVEL MONITORING

Mining and allied activities usually cause noise pollution. Excessive noise levels will cause adverse effects on human beings and associated environment including domestic animals, wild life, natural ecosystem and structures. To know the ambient noise levels in the study area, noise levels were recorded at mining area and nearby villages using noise level recorder.

WATER QUALITY MONITORING

Water quality monitoring consists of the study of surface and ground water sources and its quality in the core and buffer zone of the lease area. Assessment of water quality in the study area and in the mine area includes the quality assessment of parameters as per the Indian Standard IS 10500 (Drinking water standard). Water samples were collected from selected locations during study period and analyzed in the laboratory as per the standard IS&APHA procedures.

MICROMETEOROLOGY

Meteorological scenario helps to understand the trends of the climatic factors. It also helps in the identification of sampling stations in the study area. Meteorological scenario exerts a critical influence on air quality as the pollution arises from the interaction of atmospheric contaminants with adverse meteorological conditions

MICRO-METEOROLOGY

Meteorological data within the project area during the air quality survey period was assessed

PRIMARY / BASIC METEOROLOGICAL PARAMETERS

- Wind Velocity
- Wind Direction

Since the dispersion and diffusion of pollutants mainly depend on the above factors these factors are considered as primary meteorological parameters.

SECONDARY METEOROLOGICAL PARAMETERS

- Ambient Temperature

ENVIRONMENTAL QUALITY

Environmental monitoring includes air, noise, water quality status within core zone and buffer zone around the Durgmanwadi Bauxite Mines Lease area at Radhanagari Taluka, Kolhapur district, Maharashtra.

AMBIENT AIR QUALITY

The ambient air quality monitoring was to assess the existing levels of the air pollution as well as the regional background concentration in the project area. Air pollution forms an important and critical factor to study the environmental issues in the mining areas. Thus, air quality has to be frequently monitored to know the extent of pollution due to mining and allied activities.

Ambient air quality monitoring stations were set up at eight selected locations, 3 in core zone and 5 in buffer zone.

METHOD OF SAMPLING

Ambient air quality monitoring has been carried out using APM-460BL instruments placed at a height of 3mts from the ground level with a frequency of two days per week at eight locations for one season (i.e. 24 times at each location in a season). The baseline data for air environment is generated for the parameters like suspended particulate matter (SPM), Particulate matter (PM10), Sulphur Dioxide (SO₂) and Oxides of Nitrogen (NO₂):

AMBIENT NOISE LEVEL QUALITY

Noise is nothing but unwanted sound produced due to various activities. As a part of occupational health and safety measures, certain safeguards have been incorporated to mitigate noise pollution in working environment. So noise level surveys were carried out at 8 selected locations in and around the mine lease area. Noise survey has been conducted in the study area for the period of 24 hr at each location. The noise level results are given below.

AMBIENT NOISE LEVEL MONITORING STATIONS

SL. NO	CODE	NAME OF SAMPLING LOCATION	DIRECTION w.r.t. MINES
1	N - 1	Core zone	--
2	N - 2	Near Mines Office	--
3	N - 3	Mines Haulage Road	--

5	N - 5	Durgmanwad village	E
6	N - 6	Kariwade village	SW
7	N - 7	Manbet village	NW
8	N - 8	Chavanwadi village	NE

NOISE AMBIENT STANDARDS

AREA CODE	CATEGORY OF AREA	LIMIT IN dB (A) Leq	
		DAY TIME	NIGHT TIME
A	Industrial Area	75	70
B	Commercial Area	65	55
C	Residential Area	55	45
D	Silence Area	50	40

Note:

1. Day time is reckoned in between 6 am and 9 pm.
2. Night time is reckoned in between 9 pm and 6 am.
3. Silence zone is defined as area upto 100 meters around such premises as hospitals, educational institutions and courts. The silence zones are to be declared by the Competent Authority.
4. Mixed categories of areas should be declared as "one of the four above mentioned categories by the Competent Authority and the corresponding standards shall apply.

RESULT & DISCUSSION

The obtained L_d, L_n noise levels are compared with the ambient noise level standards and are found to be within the limit.

WATER QUALITY

Water quality monitoring consists of the study of water sources and its quality in the core and buffer zone of the lease area. Its study consists of following two important systems of water bodies:

- ➔ Surface water quality.
- ➔ Ground water quality.

The buffer zone is good in ground and surface water source. The rainwater regularly recharges this ground water during rainy season. There are two streams flowing in the study area, which are considered to be good source of water.

Assessment of water quality in the study area and in the mine area includes the quality assessment of parameters as per the IS 10500 (Drinking Water Standard). A total of 6 quality monitoring stations selected for sample collection in the study area. Location of water quality monitoring stations is given in Table.

WATER QUALITY MONITORING LOCATIONS

Sl. No		Name of Sampling Station	Source of Water
1	W1	Talgaon village	Ground water
2	W2	Durgamanwadi village	Ground water
3	W3	Chavanwadi village	Ground water
4	W4	Padsali village	Surface water
5	W5	Tulsi stream	Surface water
6	W6	Mine Accumulated water	Surface water

SAMPLING DETAILS

The water samples were collected from selected sampling locations, which are coming under core zone and buffer zone around the mine lease area. Samples were collected in the Post Monsoon season as per the prescribed sample collecting methods and analyzed as per the IS & APHA standard procedures. analysis report of water samples are given below.

RESULTS & DISCUSSION

- The pH of the study area varies from 6.54 to 6.97 in the study area. The permissible range of pH is 6.5 to 8.5.
- Dissolved Oxygen content of the study area has been found to be in the range of 4.90 to 7.20.
- Total Dissolved Solids found to be in the range of 31.5 to 111.30 mg/l in the water sample collected in study area. As per IS 10500 standard for drinking water, the desirable limit is 500 mg/l and maximum permissible limit is 2000 mg/l.
- Alkalinity as CaCO₃ is found to be in the range of 9.30 to 36.4 in the water sample collected in study area. As per IS 10500 standard for drinking water, the desirable limit is 200 mg/l and maximum permissible limit is 600 mg/l.
- Total hardness as CaCO₃ of the water sample collected in the study area is found to be in the range of 16.7 to 64.0 mg/l. As per IS 10500 standard for drinking water, the desirable limit is 300 mg/l and maximum permissible limit is 600 mg/l.
- Chloride content of the water in the study area found to be in the range of 8.0 to 32.0 mg/l. As per IS 10500 standard for drinking water, the desirable limit 250 mg/l and maximum permissible limit is 1000 mg/l.
- Calcium content of the water in the study area found to be in the range of 3.9 to 16.4 mg/l. As per IS 10500 standard for drinking water, the desirable limit 75 mg/l and maximum permissible limit is 200 mg/l.
- Magnesium content of the water in the study area found to be in the range of 1.7 to 5.6 mg/l.
- Iron content of the water in the study area found to be in the range of 0.12 to 0.21 mg/l. As per IS 10500 standard for drinking water, the desirable limit 0.3 mg/l and maximum permissible limit is 1.0 mg/l.
